

UNBUNDL

Frontend Developer

Take-Home Assessment

Level	Duration	Stack
Junior (0–2 yrs)	48 hours	React + Dynamic Section

This document is confidential. Do not share beyond the hiring team.

1. Overview

You are applying for a Frontend Developer role at Unbundl, a digital and tech services company that builds websites and web applications for D2C brands, SMEs, and enterprise clients.

The developer you would be replacing worked on Whistle's website — a React frontend with a Laravel backend. The core of that role involved building UI components from Figma designs and wiring them up to live data.

This assessment replicates that workflow in a single, focused task: you will build a React page section that pulls dynamic data from an API and renders it according to a provided Figma design.

2. What We're Looking For

At the junior level, we are not expecting architectural expertise. We are evaluating:

- Accuracy — how closely your output matches the Figma design
- Cleanliness — readable, organised, well-structured code
- Data handling — correct use of `useEffect`, `useState`, loading and error states
- Responsiveness — layout holds correctly across screen sizes
- Communication — a clear README and tidy submission

3. Figma Access

You will receive a Figma link separately. It contains one frame: a page section design for Whistle's website, including desktop and mobile views.

Figma link:

<https://www.figma.com/design/wwwg2F5mt58lCsRhDQlrT/Untitled?node-id=0-1&t=CpJKLaHz8noyzGla-1>

To access the elements in the figma file, you need to create a file of your own and copy paste the design in your file.

4. The Task — React Page Section with Dynamic Data

Task A — Build the section from Figma

Recreate any **3 Figma frame** as a React functional component. It should match the design as closely as possible: layout, spacing, typography, colours, and component structure.

Requirements:

- Use functional components with React hooks
- Match the Figma design (layout, spacing, colour, typography)
- **Write your own CSS — no UI libraries (Material UI, Ant Design, Chakra, etc.)**
- You may use CSS modules, plain CSS, or inline styles — be consistent
- Images: use placeholder URLs (e.g. picsum.photos) sized to match the Figma

Task B — Populate with dynamic data

Fetch data from one of the public APIs below and render it inside your component. Choose the API that best fits the content shown in the Figma design.

API	Example endpoint
Fake Store API	https://fakestoreapi.com/products
DummyJSON	https://dummyjson.com/products
JSONPlaceholder	https://jsonplaceholder.typicode.com/posts

If the Figma content does not map well to any of the above, you may create a local JSON file with mock data and import it instead. If you do this, explain it in your README.

Requirements:

- Use `useEffect` and `useState` for the fetch lifecycle
- Show a visible loading state while data is being fetched (spinner, skeleton, or text — your choice)
- Handle errors gracefully — if the fetch fails, display a user-friendly message rather than a blank screen

Task C — Add one interaction

Implement one working interaction that is present in the Figma design. The interaction must be intentional and match what the design shows — do not invent something not in the frame. Examples of what might appear:

- A hover state on a card or button
- A filter or sort toggle that changes which items are shown
- An expand/collapse on a panel or accordion
- A tab switch between two content views

If the Figma does not include an explicit interaction, add a hover state on the primary interactive element (card, button, or link) that is consistent with the design's visual language.

Deliverable

Item	Details
Repo	Push to a public GitHub repository. No node_modules folder.
How to run	Must run with: npm install then npm run dev (Vite) or npm start (CRA).
README.md	Include: setup instructions, which API you used, and a short note (2–3 sentences) on your approach.
Submission	Share the GitHub repo link in your submission email.

5. Submission Instructions

Send your submission to the person who shared this brief. Use the following subject line format:

Email subject format
Frontend Assessment — [Your Full Name] — [Submission Date]

Example: Frontend Assessment — Aryan Mehta — 27 May 2025

Your email should include:

- 1. GitHub repository link (confirm it is set to Public before sending)
- 2. A brief paragraph (3–5 sentences) on what you found challenging and what you would improve given more time

Deadline reminder
Your submission must arrive within 48 hours of receiving the Figma link. Late submissions will not be reviewed unless you have notified us in advance and received an extension in writing.

6. Rules & Expectations

Rule	Details
Work must be your own	You may use documentation, Stack Overflow, and AI tools as references — but the code submitted must be written by you. Do not submit a template or copied repo.
Commit hygiene	Make at least 3 commits during development. A single commit at the end raises a red flag.
TypeScript is welcome	You may use TypeScript. It will not score higher or lower than JavaScript.
Asking questions is fine	If something in the Figma is unclear, email within 6 hours of receiving the link.

7. Frequently Asked Questions

Can I use SCSS or CSS modules?

Yes — SCSS or CSS modules are both fine. Just be consistent throughout.

Can I use Vite or Create React App?

Either is fine. Vite is preferred since it's faster to set up, but CRA works too. Just make sure the run command is in your README.

What if the public API doesn't match the Figma content?

Create a local JSON file with mock data that fits the design and import it into your component. Mention this in your README.

Do I need to deploy anything?

No. A local run is sufficient. If you'd like to deploy to Vercel or Netlify as a bonus, that's welcome — but it won't affect your score.

Can I ask about the design during the 48 hours?

Yes — but email us within the first 6 hours. We cannot guarantee a response after that window.
